Julio Saito

Senior Software Engineer
Ubatuba, São Paulo, Brazil

Summary

Senior Software Engineer with 20+ years of experience building complex web platforms, cloud-based systems, and business-critical software. Specialized in TypeScript, Node.js, React, Next.js, cloud architectures, and modern full-stack development. I combine strong software engineering fundamentals with advanced AI-assisted development practices. My current focus is on orchestrating AI agents as part of the software development lifecycle, using them not as code generators only, but as structured collaborators for research, specification, implementation, testing, refactoring, documentation, and validation. I work with a methodical approach based on Spec-Driven Development, TDD, automated testing, clear technical context, and architectural decision-making. I use AI agents to accelerate delivery while maintaining engineering ownership: defining requirements, decomposing problems, reviewing generated solutions, validating edge cases, improving test coverage, and ensuring the final software remains robust, maintainable, and aligned with business goals. Throughout my career, I have led critical development initiatives, simplified complex architectures, migrated systems to scalable cloud and serverless solutions, and contributed to high-impact products in commerce, M&A, customer service, live shopping, and internal business platforms. I am especially interested in challenges where advanced software engineering, AI agent orchestration, product thinking, and reliable architecture come together to create practical, scalable, and well-tested solutions.

Experience

Soma Deals
Senior Software Engineer
August 2025 - May 2026 (10 months)
São Paulo, Brazil

Worked as a full-stack engineer on a digital M&A platform for small and medium-sized businesses, contributing to tools that support company buying and selling workflows.

Developed front-end features using Next.js, React, and TypeScript, with a focus on usability, maintainability, and business-oriented flows.

Maintained and evolved backend services built with Python, supporting core platform operations and business logic.

Managed AWS infrastructure and cloud services to improve reliability, security, and scalability.

Collaborated on product and technical decisions, helping transform complex M&A processes into intuitive digital workflows for business owners and industry professionals.

Linx Commerce

Solutions Architect

December 2021 - June 2024 (2 years 7 months)

São Paulo, Brasil

Led the development of an innovative WhatsApp-based customer service and commerce system, integrating product listings, virtual cart flows, and dynamic conversation experiences.

Acted across multiple roles, including Senior Developer, Product Owner, and Scrum Master, helping align technical execution with product requirements and team delivery.

Simplified system architecture to make the codebase easier to understand, maintain, and evolve by other developers.

Migrated parts of the architecture from Kubernetes to serverless solutions using Vercel and AWS Cloud Functions, reducing operational complexity and improving scalability.

Optimized PostgreSQL usage on Google Cloud, supporting better performance and reliability for commerce-related workloads.

Semantix

Senior Web Developer

November 2020 - December 2021 (1 year 2 months)

São Paulo, Brasil

Implemented live-shopping and intelligent-chat features using VTEX and Dialogflow, contributing to digital commerce and customer engagement solutions.

Developed and maintained web applications with Next.js, improving website functionality, user experience, and integration capabilities.

Collaborated on open-source initiatives and reusable front-end components to support faster development and better maintainability.

Worked closely with product and engineering teams to deliver features aligned with business goals and customer needs.

Latife Gastronomia Árabe

CTO

February 2017 - November 2020 (3 years 10 months)

Greater São Paulo Area

Managed end-to-end IT operations for a family-owned food business, covering software development, infrastructure, tools, and internal processes.

Built and maintained web systems using TypeScript, Next.js, Hasura, and related technologies to support business operations.

Organized project workflows using Trello and GitHub Projects, improving visibility, prioritization, and execution.

Maintained cloud infrastructure across AWS, Heroku, Google Cloud, and Vercel, selecting the most appropriate platform according to cost, simplicity, and operational needs.

Supported the business with practical software solutions, process improvements, and technical decision-making.

Azuki (azukiapp.com)

Software Engineer

October 2014 - November 2016 (2 years 2 months)

São Paulo

Contributed to the development and strategic evolution of AZK, an open-source CLI tool designed to automate development environment setup and management.

Built core features using Node.js, helping developers create reproducible local environments before Docker Compose became widely adopted.

Supported the open-source community by helping users understand, adopt, and contribute to the project.

Applied TDD practices to improve reliability, maintainability, and confidence in the tool's behavior.

Worked with APIs, containerization concepts, Docker, developer tooling, and open-source project management.

Integgro Tecnologia da Informação

Web Developer

2013 - 2013 (less than a year)

São Paulo Area, Brazil

- Developed web applications using Asp.Net MVC and JavaScript at Integgro Tecnologia da Informação.
- Implemented a continuous integration server that has been running smoothly since then.

Grupo SHC

Programmer and Technical Instructor

March 2006 - September 2012 (6 years 7 months)

Greater São Paulo Area

Acted as technical architect and developer for Apollo Web, one of Grupo SHC's largest internal software projects for vehicle sales and after-sales operations.

Defined technologies, development practices, and architectural patterns used by the team throughout the project.

Developed and maintained the application using ASP.NET, SQL Server, NHibernate, SAP integrations, and Castle Windsor.

Applied object-oriented design and DDD-inspired layered architecture to improve maintainability and separation of concerns.

Implemented automated tests using NUnit, Moq, and Selenium to improve software quality.

Created and maintained the continuous integration environment using TeamCity, Rake, and Albacore.

Delivered technical training and created internal documentation through a wiki and blog, helping spread knowledge across the team.

Integrated the system with SAP using ERPConnect from Theobald Software.

everis, Consulting, IT, Outsourcing & Professional Services

Programmer Analyst

May 2005 - February 2006 (10 months)

Worked on Santander Banespa projects involving web development, system analysis, database migration, and internal tooling.

Developed applications using ASP, Visual Basic 6, Oracle packages, and supporting technologies.

Led web development activities and communicated directly with the client to clarify requirements and support delivery.

Created automation macros to speed up repetitive development and maintenance tasks.

Worked on secure password registration workflows involving anti-trojan and encryption-related requirements.

GEMPI

Junnior Developer

August 2003 - April 2005 (1 year 9 months)

Worked on Embratel and Telemar projects involving web development, Oracle packages, and data migration support.

Created technical and functional specifications for database migration processes.

Developed applications using Visual Basic 6, ASP, and Oracle.

Supported project management activities and collaborated with teams on enterprise telecom systems.

Education

Faculdade de Tecnologia de São Paulo - FATEC-SP

Tecnólogo, IT · (2001 - 2006)
